An Overview of the Whole Story:

Overview of the Games Story;

The theme setting of the story begins with a Bleeding Edge, the crumbling barrier of the Multiverse. The Traveler awakens here, summoned by the Monitor. The Multiverse is destabilizing, timelines colliding, and the Source Wall's collapse has unleashed Anti-Life corruption. From the very beginning, the player is presented with a binary choice: follow the Speed Force into Flashpoint's broken timeline, or step through a Boom Tube into Apokolips' cosmic war.

The key plot and potential endings of my story starts with a Timeline Repair (Path A) which explores the cost of tampering with time. The choices of the story tests whether the player values allies for characters like the Traveler and the Doppelganger.

The Cosmic War (Path B) explores the weight of cosmic-scale decisions. Should the player confront overwhelming evil directly (Kalibak, Darkseid), or manipulate the battlefield with strategy (Motherbox, Orion).

Both arcs funnel into Earth-Prime, where the ultimate mirror is revealed where the corrupted doppelganger Traveler lives. This confrontation symbolizes the temptation of power vs. preservation of identity. Users must decide whether to fight (externalizing conflict) or reason (internal struggle).

The endings of the story reflect different stances which are the Collapse Ending which means the player failed to overcome the existential despair, Corrupted Ending means that the Traveller would surrender to temptation from the villain's origin, Hero Ending, this means that the classical victory with allies and restoration, The Bittersweet Ending this means a noble sacrifice for the to be player erased, True Ending meaning that the traveler transcendence becomes the Monitor, guardian of infinite timelines.

The moral of my story conveys the narrative of emphasising that even heroes face ethical dilemmas and decision making complex. The story also emphasises that that small decisions can have large-scale consequences, mirroring real-life responsibility and choice

Justification of the whole story:

The User Experience choices behind my wireframe was designed for clarity and ease of navigation. A top navigation bar and minimal scrolling maintain user focus on the story. Choices are presented through large, accessible buttons to improve readability and interaction, aligning with the basic usability of the DC games and stories in itself.

The colours I used for the story project were a dark palette (black, grey, and deep blue) to evoke the dramatic tone of the DC universe, contrasted with bright accents for key decision buttons to indicate player agency. The typography I used where headings use the 'Bebas Neue' font to give a comic-book aesthetic, while body text uses 'Roboto' for legibility. The icons I chose for the mock-ups and the game in itself were the figma icons from the Material Design set which were used to represent navigation and choices, ensuring familiarity and accessibility.

The technical implementation for the solutions of the game was the React app which uses a component-based architecture, allowing reusable modules for choice buttons, text boxes, and media elements. I integrated simple CSS animations to enhance engagement without compromising performance. The responsive layout ensures cross-device compatibility. I also used some data structures like JSON file for story nodes and manual user testing for flow and readability.

Evaluation of the whole story

The User Experience of my game showed that the branching structure was clear, and players appreciated the freedom of choice. The visual consistency and story pacing helped maintain engagement. However, some users reported occasional text overflow on smaller screens, indicating a need for further responsive design optimization

How effectively have I implemented the solution? The most effective way I implemented the final build successfully was through implementing the core features planned in the flowchart, including branching narratives and decision feedback. React's component structure enabled clean code reuse, though dynamic media loading introduced some lag, which could be optimized in future updates.

How I would like to improve the project in the future would be by adding audio/visual feedback for choices, Introducing accessibility improvements (text-to-speech or high-contrast mode), refine the UI with micro-animations and improved mobile layouts.
